

Lab 2.1

Create an ApplicationContext

In your starter directory, import the project for Lab02.1 i.e. Student

This is a Spring Boot Maven project with classes already populated in it and the Spring Boot Starter dependencies in the maven pom

In the provided beans.xml define a single BeanDefinition for StudentServiceImpl with an id of "studentService"

Use the provided Test class (StudentServiceTest) to define an ApplicationContext using the beans.xml. Use your slides to create the context and bring back the StudentServiceImpl bean using its id

Remember to use the Interface StudentService when retrieving the instance
