Lab 2.2

Using @Query

- In the Interface StudentRepository, remove the findByDepartment method and replace it with;

```
@Query("SELECT student FROM Student student where student.dept = :dept")
Collection<Student> getByDept(@Param("dept") String department);
```

- Then make the necessary code change in the class StudentServiceImpl to use this new method

- Relaunch the Spring Boot Application, test using your Angular client app, it all still works
